## Oscilloscope Calibration Options for **55XX Series Multi-Product Calibrators**

### Extended Specifications

These specifications apply to the 5520A-SC1100, 5500A-SC600 and 5500A-SC300 Oscilloscope Calibration Options. For general specifications, see the Extended Specifications for the individual calibrator of interest (downloadable from the Fluke Calibration web site or available from your Fluke Calibration representative). The specifications are valid when the calibrator is operated under the conditions specified in the operator manual, and has completed a warm-up period of at least twice the length of time the calibrator was powered off, up to a maximum of 30 minutes.

The 5520A-SC1100, with 1100 MHz bandwidth, can be installed in a 5522A calibrator. The 5500A-SC600, with 600 MHz bandwidth, can be installed in any 55XX Series Multi-Product Calibrator. The 300 MHz option, the 5500A-SC300, is only compatible with the 5502A calibrator.

## Overload Measurement Specifications

**5520A-SC1100 and 5500A-SC600.** The overload test function applies dc or ac (1 kHz square wave) power into the 50 Ω oscilloscope input and monitors the current. A time measurement counter indicates the time duration of the applied overload signal. When the oscilloscope's input protection circuit reacts and opens up the 50 Ω load, the calibrator indication is set to "off" on the right hand display. In order to prevent oscilloscope front end damage, a limited amount of energy is applied by a user settable time limit.

Source Voltage	Time Limit dc or 1 kHz ac
5 V to 9 V	Settable from 1 Sec to 60 Sec
Typical "On" Current Indication	Typical "Off" Current Indication
5 V to 9 V	Settable from 1 Sec to 60 Sec

### External Frequency Reference Input (5522A only)

The External Reference Input selection allows the user to provide their own high stability 10 MHz reference clock for the 5500A-SC600 and 5520A-SC1100 when fitted in a 5522A mainframe. All functions except Wave Generator and Marker greater than 50ms are then referenced to the external 10 MHz signal. The external reference input must be between 1 V to 5 V p-p.

Uncertainty of output = uncertainty of reference + 5 μHz.
